DESCRIPTION:
The Precontrol® Standard Toric, Precontrol® Toric XR, and Precontrol® Toric XR Soft (Hydrofilcon A) contact lens systems are hydrophilic contact lens hemispherical shells of the following dimensions:

- **Precontrol® Standard Toric XR**:
  - **Diameter**: 14.0 ± 0.25mm
  - **Base Curve**: 8.6 ± 0.15mm
  - **Center Thickness**: 0.030 ± 0.015mm
  - **Power Range**: ±7.00 to ±18.00 D

- **Precontrol® Toric XR Soft (Hydrofilcon A)**:
  - **Diameter**: 14.0 ± 0.25mm
  - **Base Curve**: 8.6 ± 0.15mm
  - **Center Thickness**: 0.030 ± 0.015mm
  - **Power Range**: ±7.00 to ±18.00 D

- **Precontrol® Standard Toric**:
  - **Diameter**: 13.5 ± 0.15mm
  - **Base Curve**: 8.0 ± 0.15mm
  - **Center Thickness**: 0.034 ± 0.015mm
  - **Power Range**: ±0.25 to ±8.00 D

- **Symmetry**: 1 to 180°

| Call our Customer Service Department at (800)-341-2002 for current availability. |

The lens material, tetrafilcon A, is a hydrophilic random terpolymer of 2-hydroxyethyl methacrylate, 2-hydroxyethyl methacrylate, and methylnethacrylate joined in a three-dimensional network of terpolymer chain. This unique lens material is supplied with a handling time of 90 minutes after being humidified and equilibrated with saline. The lens material is compatible with C.I. Reactive Blue 163 dye to impart a light blue tint on the lens. The handling tint increases the visibility of the lens when not worn on the eye.

**WARNINGs**
- **Patients should be advised of the following warnings pertaining to contact lens wear:**
  - Problems with contact lenses and lens care products could result in serious injury to the eye. It is essential that patients follow their specific written instructions. Contact lens wearers should rely only on the written directions for all labeling instructions for proper use of lenses and lens care products, including the lens care case. Eye problems, including corneal ulcers, can develop rapidly and lead to loss of vision.
  - All contact lens wearers must see their eye care practitioner as directed.
  - Daily wear lenses are not indicated for overnight wear and patients should be instructed not to wear lenses while sleeping. Clinical studies have shown that the risk of serious adverse reactions is increased when these lenses are worn overnight.
  - The risk of ulcerative keratitis has been shown to be greater among users of extended wear lenses than among users of daily wear lenses. The risk of extended wear user increases with the number of consecutive days the extended wear users wear the lenses, beginning with the first overnight use. This risk can be minimized by using the lens care system specifically indicated for routine lens care, including cleaning the lens case.
  - Studies have shown that contact lens wearers who are smokers have a greater risk of experiencing more severe reactions than nonsmokers.
  - If the patient experiences eye discomfort, excessive tearing, vision changes, or redness of the eye, the patient should be instructed to immediately remove the lenses and promptly contact his or her eye care practitioner.

**PRECAUTIONS**
- **Special Precautions for Eye Care Practitioners**:
  - Due to the small numbers of patients enrolled in clinical investigations of lenses, all refractive powers, design configurations, or lens parameters available in the lens material are not evaluated in all clinical investigations of lenses. The eye care practitioner should consider all characteristics of the lenses that can affect lens performance and corneal health, including oxygen permeability, lens material hydration, central and peripheral thickness, and optic zone size.
  - The potential impact of these factors on the patient’s ocular health should be considered against the patient’s need for corrective lens care; therefore, the continuing ocular health of the patient and lens care must be carefully monitored by the prescribing eye care practitioner.
  - Aphakic patients should not be fitted with tetrafilcon A contact lenses until the determination is made that the eye has healed completely.
  - Fluorescein, a yellow dye, should not be used while the lenses are on. The lenses absorb the dye and become discolored. Whenever fluorescein is used in the eyes, the eyes should be flushed with a sterile saline solution that is recommended for in-eye use.
  - Before leaving the eye care practitioner’s office, the patient should be able to produce, handle, and wear contact lenses. Producers of a lens care system available can remove the lenses for him or her. Eye care practitioners should instruct the patient to remove the lenses immediately if the eye becomes red or irritated.

**ADVERSE EFFECTS**
- **The patient should be informed that the following problems may occur:**
  - Eyes stinging, burning, or itching (irritation), or other eye problems.
  - Some discomfort in vision.
  - Redness of the eyes.
  - Eyes become dried out.
  - Sensation of light (photophobia).
  - Dry eyes.

- **If the patient notices any of the above, he or she should be instructed to:**
  - Immediately remove the lens.
  - If the discomfort or the problem stops, then look closely at the lenses. If the lenses are in some way damaged, do not put the lens back on the eye. Place the lens in the storage case for a few seconds to see if the eye care practitioner. If the lens has dirt, an eyelash, or foreign body on it, or the problem stops, and the lens appears damaged, the patient should thoroughly cleanse, rinse, and disinfect both lenses; then rinse them. After rinsing, if the problem continues, the patient should immediately remove the lenses and consult the eye care practitioner.
General
Eye care practitioners should review with the patient lens care instructions (see below) to ensure that the lens is cleaned, rinsed, and stored properly. Additionally, the patient should consult the labeling on the lens care system for specific instructions.
