Extended Wear: The tetrafilcon A lenses are indicated for extended wear from 1 to 7 days between replacements for cleaning and disinfecting as recommended by the eye care practitioner. They are indicated for extended wear in non-aphakic persons with non-diseased eyes that are myopic. The lenses may be worn during sleep and may exhibit astigmatism of 2.00 diopters or less that does not interfere with visual acuity.

Eye care practitioners may prescribe the lens for frequent replacement rather than scheduled cleaning and disinfecting, and scheduled replacement (see WEARING SCHEDULE).

CONTRADICTIONS (REASONS NOT TO USE):
- Acute and subacute infection or inflammation of the anterior chamber of the eye.
- Any eye disease, injury, or abnormality that affects the cornea, conjunctiva, or eyelids.
- Severe insufficiency of tear film ocular sensation (dry eyes).
- Corneal hypoplasia (reduced cornea sensitivity), if not aphakic.
- Any systemic disease that may affect the eye or be exacerbated by wearing contact lenses.
- Allergic reactions of the ocular surface or skin that may be induced or exacerbated by wearing contact lenses or use of contact lens solutions.
- Allergic reaction to any ingredient, such as mercury or thimerosal, in a solution which is to be used to care for the tetrafilcon A lens.
- Any active corneal infection (bacterial, fungal, or viral).
- Allergic reactions of the ocular surface or skin that may be induced or exacerbated by wearing contact lenses.
- Any active or inactive corneal infection (bacterial, fungal, or viral).
- If the discomfort or the problem stops, then look closely at the lens. If the patient continues to use the lens, then a lens examination should be performed.
- The patient is unable to follow lens care regimen or unable to obtain lens care assistance to do so.

CAUTION: FEDERAL (USA) LAW RESTRICTS THIS DEVICE TO SALE BY OR ON THE ORDER OF A LICENSED PRACTITIONER CooperVision, Inc., Scottsdale, AZ 85255

DESCRIPTION:
The Preference Standard, Preference Toric XR, and Preference Toric XR (tetrafilcon A)-Soft (Hydrophilic) Contact Lens are hemispherical shells of the following dimensions:

<table>
<thead>
<tr>
<th>Preference Standard</th>
<th>Preference Toric XR</th>
<th>Preference Toric XR (tetrafilcon A)-Soft (Hydrophobic)</th>

To order, call your CooperVision Customer Service Department at (800) 344-6611.

The tetrafilcon A, tetrafilcon A-Soft (Hydrophilic), and tetrafilcon A-Hydro (Hydrophobic) are indicated for extended wear use by not-aphakic and not-aphakic persons with non-diseased eyes. The lenses may be worn during sleep and may exhibit astigmatism of 2.00 diopters or less that does not interfere with visual acuity.

The tetrafilcon A Contact lens is indicated for daily wear use by not-aphakic persons without non-diseased eyes that are myopic or hyperopic. Preference Standard contact lenses are intended for daily wear use by not-aphakic persons with non-diseased eyes that are myopic or hyperopic. The lenses may be worn during sleep. The lenses may be worn by persons with astigmatism of 5.00 diopters or less that does not interfere with visual acuity.

Preference Standard Toric XR contact lenses are indicated for daily wear for the correction of astigmatism up to 9.00 diopters (in the spherical range). The lenses may be worn during sleep and may exhibit astigmatism in non-aphakic persons with non-diseased eyes.

INDICATIONS (USES):
- Daily Wear
  - The tetrafilcon A lenses are indicated for daily wear by not-aphakic persons with non-diseased eyes that are myopic. Preference Standard contact lenses are indicated for daily wear use by not-aphakic persons with non-diseased eyes that are myopic or hyperopic. The lenses may be worn by persons with astigmatism of 5.00 diopters or less that does not interfere with visual acuity.
  - Preference Toric XR contact lenses are indicated for daily wear for the correction of astigmatism up to 9.00 diopters (in the spherical range). The lenses may be worn during sleep and may exhibit astigmatism in non-aphakic persons with non-diseased eyes.

INDICATIONS (USES):
- Daily Wear
  - The tetrafilcon A lenses are indicated for daily wear by not-aphakic persons with non-diseased eyes that are myopic. Preference Standard contact lenses are indicated for daily wear use by not-aphakic persons with non-diseased eyes that are myopic or hyperopic. The lenses may be worn by persons with astigmatism of 5.00 diopters or less that does not interfere with visual acuity.
  - Preference Toric XR contact lenses are indicated for daily wear for the correction of astigmatism up to 9.00 diopters (in the spherical range). The lenses may be worn during sleep and may exhibit astigmatism in non-aphakic persons with non-diseased eyes.
**CARE FOR A DRIED OUT (DEHYDRATED) LENS:**

- Clean one lens first (always the same lens first to avoid mix-ups), rinse the lens thoroughly with recommended saline or disinfection solution to remove any debris or protein deposits, and store the lens in the closed storage case. Then repeat the procedure for the second lens.

- After cleaning and rinsing, disinfect lenses using the system recommended by the manufacturer and observe the use guidelines.

- To store lenses, disinfect and leave them in the closed/unopened case until ready to use. If lenses are not to be used immediately following disinfection, store in a recommended storage solution.

**General Lens Care:** Contact lenses and lens cases need proper care to prevent infection. Here are some basic instructions:

- Always wash, rinse, and dry hands before handling contact lenses.
- Always use fresh, unwrapped lens care solutions.
- Use the recommended solution for each lens and lens case, and do not use alternate or mix lens care systems unless indicated on solution labeling. Some solutions may have more than one function, which will be indicated on the label. Read the label on the solution bottle before following directions.

- When cleaning, rinse, and disinfect contact lenses, always use the recommended solution for each lens and lens case, and do not use alternate or mix lens care systems unless indicated on solution labeling. Some solutions may have more than one function, which will be indicated on the label. Read the label on the solution bottle before following directions.

- Lenses should be cleaned, rinsed, and disinfected each time they are removed. Cleaning and rinsing are necessary to remove mucus and film from the lens surface. Disinfecting is necessary to destroy harmful germs. Always remove, clean, rinse, and disinfect the lenses as recommended by the eye care practitioner.

- Use the recommended system of lens care and carefully follow instructions on solution labeling. Different solutions cannot always be used to clean with all lenses. Do not alternate or mix lens care systems unless indicated on solution labeling. Some solutions may have more than one function, which will be indicated on the label. Read the label on the solution bottle before following directions.

- Lens cases should be emptied, cleaned, and allowed to air dry. Lenses that are chemically disinfected may absorb ingredients from cleaning and disinfecting solutions. Removing protein deposits is important for the well-being of the patient’s lenses and eyes. If these deposits are not removed, they may become dry and brittle and need to be rehydrated. If the lens is adhering to a surface, apply sterile saline solution to break the bond. To rehydrate the lens:
  - Handle the lens carefully.
  - Place the lens in its storage case and soak the lens in a recommended rinsing and storage solution for at least one hour or until it returns to a soft state.
  - Clean the lens first, then rehydrate the lens using a recommended lens care system. If after soaking, the lens does not become soft, if the surface remains dry, the lens should not be used unless it has been examined by the eye care practitioner.

**CARE FOR A STICKING (NONMOVING) LENS:**

- After disinfecting, carefully follow instructions on solution labeling. Replacement lenses should be instructed to apply 2 to 3 drops of the recommended lubricating or rewetting solution directly to the eye and wait until the lens begins to move freely on the eye before removing it. If non-movement of the lens continues more than 5 minutes, the patient should immediately consult the eye care practitioner.

**DIAGNOSTIC LENS CARE:**

- The eye care practitioner should educate contact lens technicians concerning proper care of diagnostic lenses.
- Each contact lens is sterilized in a glass vial containing a sterile buffered isotonic saline solution.
  - Hands should be washed, rinsed, and disinfected with a lint-free towel prior to handling a lens.
  - To ensure sterility, the vial should not be opened until immediately prior to use.
  - Lenses should be surface cleaned and disinfected prior to reusing in a diagnostic procedure or dispensing to the patient.
  - Diagnostic lenses may be disinfected by heat (thermal) of chemical (not heat). Refer to the section titled “Heat (Thermal) Lens Disinfection” or “Chemical (Not Heat) Lens Disinfection”.
  - Do not alternate or mix lens care systems.

**EMERGENCIES:**

- Any contact lens solution should be refrigerated immediately upon opening the container. If a solution is not refrigerated, it should not be used. Contact lens solution should be refrigerated immediately upon opening the container.

- Storing lens cases at room temperature may cause bacterial growth. Lens cases should be emptied, cleaned, and disinfected with a recommended solution for each lens, and stored in a recommended storage solution.

**REPORTING OF ADVERSE REACTIONS:**

- All adverse experiences and adverse reactions observed in patients wearing the lens or lens case or experienced with the lenses should be reported to:
  - Allergan
  - Pliagel
  - Quick Care
  - Opti-Free®

**LENS DEPOSITS AND USE OF ENZYMIC CLEANING:**

- Enzymatic cleaning may be recommended by the eye care practitioner.

**LENS CASE CLEANING AND MAINTENANCE:**

- Contact lens cases can be a source of bacterial growth. Lenses cases should be emptied, cleaned, and disinfected with a recommended solution for each lens case, and stored in a recommended storage solution.

- Lens cases should be replaced at regular intervals as recommended by the lens case manufacturer or the eye care practitioner.

**CARE FOR A DRIED OUT (DEHYDRATED) LENS:**

- Clean one lens first (always the same lens first to avoid mix-ups), rinse the lens thoroughly with recommended saline or disinfection solution to remove any debris or protein deposits, and store the lens in the closed storage case. Then repeat the procedure for the second lens.

- After cleaning and rinsing, disinfect lenses using the system recommended by the manufacturer and observe the use guidelines.

- To store lenses, disinfect and leave them in the closed/unopened case until ready to use. If lenses are not to be used immediately following disinfection, store in a recommended storage solution.

- After disinfecting, carefully follow instructions on solution labeling. Replacement lenses should be instructed to apply 2 to 3 drops of the recommended lubricating or rewetting solution directly to the eye and wait until the lens begins to move freely on the eye before removing it. If non-movement of the lens continues more than 5 minutes, the patient should immediately consult the eye care practitioner.

**DIAGNOSTIC LENS CARE:**

- The eye care practitioner should educate contact lens technicians concerning proper care of diagnostic lenses.

- Each contact lens is sterilized in a glass vial containing a sterile buffered isotonic saline solution.
